

SEVASAATHI

Verified Home Care & Elder Support Platform

FIND
the right caregiver

BOOK
care confidently

MONITOR
care from anywhere

Project Vision

SevaSaathi is a digital platform that connects families with verified nurses and caregivers for elderly people, bedridden patients and people who need assistance with everyday care at home.

Core idea: requirement → matching → verification → booking → care updates → review.

1. Executive Summary

Problem	Families often struggle to find suitable and trustworthy home caregivers, especially when they live away from elderly parents.
Solution	A verified caregiver marketplace with smart matching, booking, care reports and family monitoring.
Users	Families / patients, caregivers / nurses, and administrators.
Initial Market	Delhi NCR, followed by other Indian cities.
Revenue	Booking commission, subscriptions, partnerships and care packages.
USP	Trust + requirement-based matching + family visibility instead of only listing caregiver contacts.

2. Problem Statement

- Elderly or dependent patients may need assistance with bathing, feeding, walking, hygiene, mobility and routine medicine reminders.
- Children and family members may work in another city or country and cannot supervise care every day.
- Informal caregiver searches do not always provide structured verification, availability or replacement support.
- Families need visibility after hiring: care status, routine task completion and daily reports.
- Caregivers need a reliable channel for genuine work opportunities.

How might we make home care easier to find, safer to coordinate and more transparent for Indian families?

3. Target Users

Create patient profile Define care needs Find and compare caregivers Book shifts Receive reports Pay and review	Create professional profile Add skills & experience Submit verification Set availability Accept jobs Submit care reports	Verify profiles Manage users Monitor bookings Handle complaints Manage payments View analytics

4. Complete User Journey

1	Family creates patient profile
2	Family selects care requirements
3	Platform finds suitable caregivers
4	Family compares verified profiles
5	Booking and payment
6	Caregiver provides service
7	Daily care report / updates
8	Family reviews the service

5. Core Product Features

Caregiver Search & Smart Matching

Match by location, skills, experience, availability and reliability.

Verification

Caregivers submit relevant identity/qualification documents; admin verifies and publishes only the verification status.

Booking & Scheduling

Select date, shift, duration and requirements; caregivers manage availability.

Daily Care Reports

Record routine care activities such as food, hygiene support, mobility assistance and medicine reminders.

Family Monitoring

Show booking status, caregiver details, reports and notifications to family members.

Reviews & Complaints

Collect reviews after completed bookings and provide an admin complaint workflow.

Urgent Care Coordination

Create an urgent caregiver request and prioritize available verified caregivers. Medical emergencies remain outside the normal booking flow.

6. Smart Caregiver Matching

A rule-based scoring engine is sufficient for the first version. AI can later assist with converting natural-language family requests into structured requirements.

Skill / requirement match	30%	Bedridden care, feeding, mobility support
Location / travel fit	25%	Caregiver close to patient
Experience	20%	Relevant years and patient category
Availability	15%	Required day/night/12-hour shift
Rating & reliability	10%	Completed bookings and reviews

Example

A family needs a female caregiver for a 12-hour night shift in Janakpuri with bedridden-care and feeding experience. The engine filters by availability and then ranks candidates by skill fit, location, experience and reliability.

7. Business Model

Booking commission	Platform takes a percentage of completed bookings.	₹1,000 service → 10% platform fee = ₹100
Family subscription	Premium plan for priority support, reports and care coordination.	₹299-₹699/month
Partnerships	RWAs, senior communities, hospitals/discharge programs and employers.	B2B / B2B2C contracts
Care packages	Structured day/night/long-term care plans.	Monthly package pricing

Simple unit-economics example

If 100 bookings in a month generate an average platform contribution of ₹100 per booking, monthly platform revenue would be ₹10,000 before operating costs. This is an illustrative example, not a forecast.

8. Technical Architecture

Frontend	React.js + Material UI + React Router + Axios
Backend	Node.js + Express.js + REST APIs
Authentication	JWT + role-based access control
Database	MongoDB
Realtime	Socket.IO for chat, booking status and notifications
Files	Secure cloud storage for profile images and verification documents
Maps	Maps API for location and distance-based matching
Payments	Razorpay / Stripe integration
Notifications	Email / push notifications
Deployment	Frontend hosting + Node API hosting + MongoDB cloud

Core Database Collections

users · patients · caregivers · verifications · services · bookings · payments · care_reports · reviews · notifications · complaints

9. Main Screens & Modules

Home Services How it works Become caregiver Contact	Dashboard Patient profile Find caregiver Booking Reports Payments Reviews	Dashboard Profile Verification Jobs Availability Earnings Reports	Dashboard Users Verification Bookings Payments Complaints Analytics

10. MVP Scope

- Authentication with family, caregiver and admin roles
- Patient profile and care-requirement form
- Caregiver profile with verification status
- Search, filters and rule-based matching
- Booking and schedule management
- Booking status notifications
- Care report submission
- Reviews and admin complaint management

Phase 2: payments, chat, maps, push notifications, caregiver replacement workflow and analytics.

Phase 3: AI-assisted requirement extraction, smarter matching, multilingual voice support and partner integrations.

11. Trust, Safety & Privacy

- Verification status must be meaningful; never claim a person is medically qualified unless the relevant credential has actually been verified.
- Identity and verification documents should be securely stored with restricted access and appropriate retention/deletion rules.
- Collect only information needed for the service and protect patient data through access controls.
- Medical emergencies should not be treated as ordinary caregiver bookings; users should be directed to appropriate emergency medical services.
- Reviews and complaints need moderation and escalation workflows.
- Care reports should distinguish routine care activities from medical diagnosis or treatment advice.
- A caregiver replacement / backup workflow should be part of the long-term product.

Trust is the product

For SevaSaathi, the most valuable feature is the confidence a family gets from knowing who is coming, why that caregiver is suitable, what was completed during the shift and how to get help when something goes wrong.

12. Competitive Positioning

Typical directory / informal search	SevaSaathi
Mostly contact discovery	End-to-end care workflow
Verification may be unclear	Verification status + admin review
Family has limited visibility	Daily reports + notifications
Manual caregiver selection	Requirement-based matching
Limited continuity workflow	Booking + schedule + replacement concept

13. Go-to-Market Plan

1	Pilot in selected Delhi NCR neighbourhoods with a small verified caregiver network.
2	Acquire first families through RWAs, local communities, referrals and caregiver networks.
3	Measure repeat bookings, caregiver reliability, complaints and family satisfaction.
4	Expand across Delhi NCR and then to other cities.

14. Development Roadmap

1	Project setup, UI system, authentication and roles
2	Family + patient profile, caregiver profile
3	Verification workflow + search/filter
4	Matching engine + caregiver detail page
5	Booking + schedule + status notifications
6	Care reports + reviews + admin dashboard
7	Payments + chat + maps
8	Testing, security review, deployment and demo polish

Success Metrics

Caregiver verification completion · successful booking rate · booking acceptance rate · repeat family bookings · average rating · complaint rate · caregiver replacement time · monthly active families.

15. One-Minute Project Pitch

SevaSaathi is a full-stack home-care platform that connects families with verified caregivers and nurses for elderly and dependent patients.

A family creates a patient profile, explains the required support and receives suitable caregiver recommendations based on skills, location, availability and reliability. After booking, the family can track care status, receive daily care reports and review the service. Caregivers get a structured profile, verification status and access to genuine work opportunities, while administrators manage verification, bookings, complaints and platform analytics.

The product is built around a simple promise: make home care easier to find, easier to trust and easier for families to monitor.
